

CSS Ideas: Hand-Drawn Kit

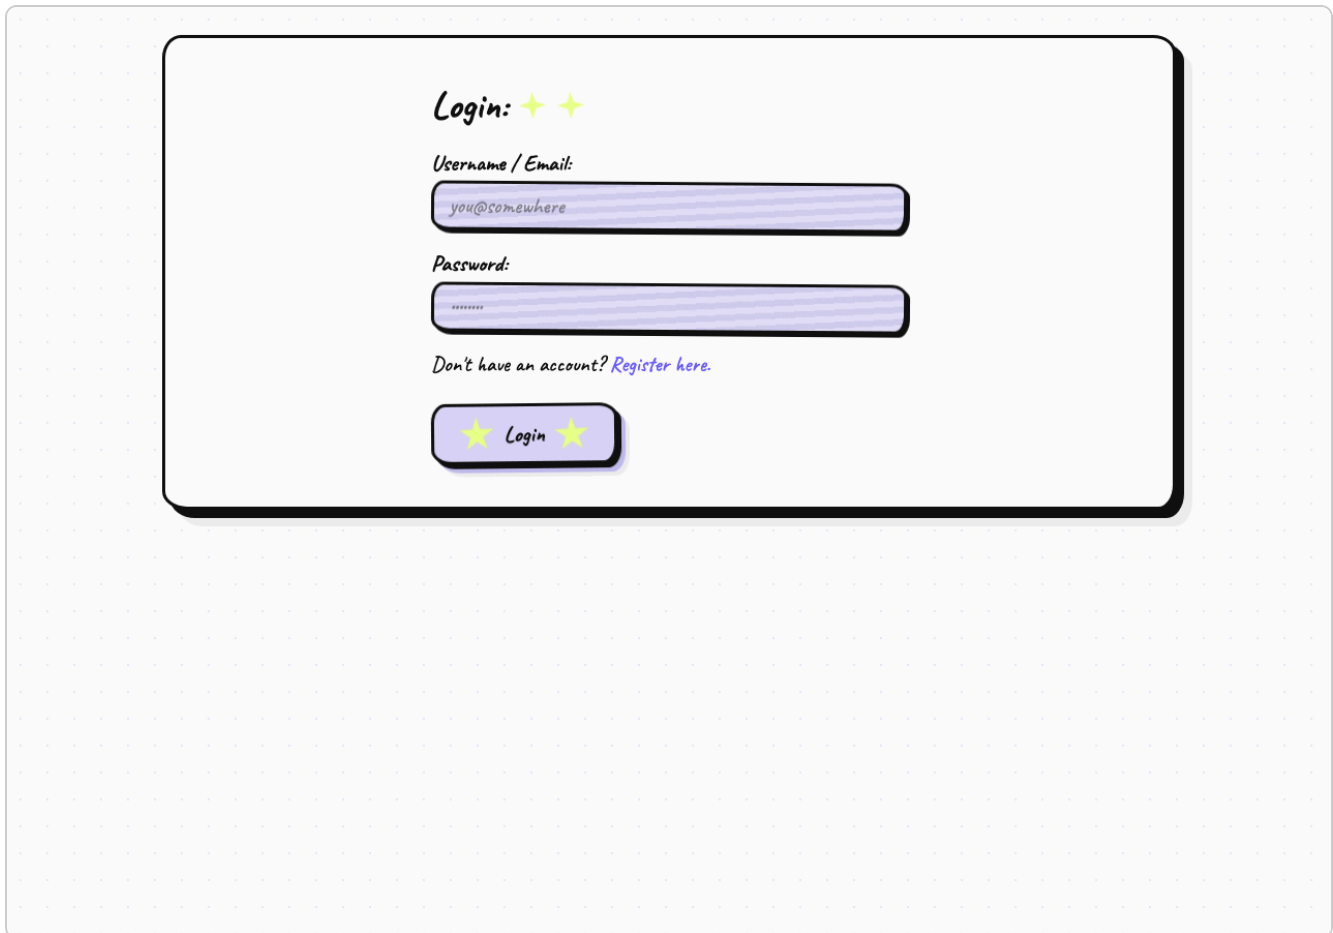

Vaughn Scott · pages and components we are going to style

1. Product page

- Two-column layout (CSS grid): product info on the left, "Other products from artist" in a sidebar with a dashed divider
- Bracket-style boxes from uneven border-radius and side-only borders, for a sketched look
- Handwriting font (Caveat) via Google Fonts

2. Login page

- Hand-drawn inputs and a 3D button: hard offset box-shadow that presses in on :active
- Dotted-paper background from a repeating radial-gradient

3. Register page

- Same kit components reused: shared CSS variables (--hd-ink, --hd-star, --hd-lavender) keep every page consistent

4. Product page, full length

- Add to Cart button with a CSS-drawn arrow and cart; star rating from CSS shapes
- Reviews section; the layout stacks to one column on phones (media query)

5. CSS Robot Lab

- A character drawn only with divs, border-radius and box-shadow, no images
- State classes change it: expressions (.expr-happy/-angry/-sleepy/-dizzy), actions (.is-walking, .is-jumping) and colors (.body-green/-purple/-blue)
- @keyframes + transform animations (walk, jump with squash and stretch)
